

YOUR HEALTHIEST SPERM MAKES PARENTHOOD MORE POSSIBLE

ZyMöt™ Sperm Separation Devices

ZyMöt is here to help ensure you're using your best, healthiest sperm.

If IUI or ICSI procedures are part of your fertility journey, you will need a sperm sample to combine with an egg in order to form an embryo.

Not all sperm are created equal

Every man, even when healthy, has a range of sperm quality in his semen. Nature isn't perfect — some sperm are good, some sperm aren't so great, and some sperm may even be dead.

If you're dealing with male-factor infertility, you may have additional sperm health challenges that could stand in the way of your success: poor swimmers (low motility), too few sperm (low count), misshapen sperm (abnormal morphology), or damage to the genetic material that sperm contain (DNA fragmentation).

No matter your age or health status, you want to put your best sperm forward.

YOUR SPERM NEEDS TO BE PROCESSED

As a part of your fertility treatment, your semen sample must be processed to find sperm that are capable of combining with an egg to form an embryo. For IUI or ICSI, your odds of treatment success go up when you use your best, healthiest sperm. Healthy sperm help create a healthy embryo and a successful pregnancy.

ZyMöt is here to help select your best sperm.

Not all sperm processing is equal

Traditionally, a clinic would process your semen sample using a spinning (centrifugation) procedure to separate out the good sperm from the bad sperm. That spinning procedure hasn't changed much since the beginning of assisted reproductive medicine, however, and scientific research has shown that spinning can damage sperm (DNA fragmentation), which can lead to poorer pregnancy outcomes.

What if there was a better way?

ZyMöt: A better way to process your sperm

Researchers have invented a better way to process sperm that doesn't spin your sample. This new, patented approach, used by ZyMöt Sperm Separation Devices, uses sperm's natural swimming abilities to separate your healthiest, best performing (motile) sperm from the rest. No spinning means no additional damage to your sperm. Healthier, more motile sperm are more likely to help you achieve a successful pregnancy.

It's that simple.

In a long and complicated fertility journey, it's easy to forget the importance of healthy sperm. ZyMöt Sperm Separation Devices offer your fertility team a new option to make sure that you use your healthiest sperm, and increase your odds of success. ZyMöt devices are the first of their kind, FDA-cleared, CE-certified, and available worldwide.
